Yongnuo yn685 nikon manual pdf

Flash powerful de Yongnuo y sencillo de manejar so en manual mode como automático. A destacar el receiver radio que lleva en su interior que lo hace compatible para dispararlo a space with los triggers de la misma brand Yongnuo modelos YN 622TX, YN 622 II, YN 622 de forma automática TTL con control sobre el flash potencias, 1a y 2a cortinilla, FEC y FEB, zoom y control de grupos - YN 560TX y flashes YN560 IV y YN 660. Control adicional de potencia de 1/128 a 1/1, control de grupo y zoom de 20 a 200mm - RF 605 dispara el flash y control de grupo - RF 603 II y RF 603 solo disparo sin control adicional. Es compatible with las cámaras Nikon en manual or automático mode. Using el disparador YN 622TX pueden controlarse todos los parámetros of the flash YN 685 a detancia como potencias, zoom, etc. Pude combinearse with el uso de otros blinks YN 685 y YN 660 entre otros. Características del flash YN 685 Nikon. - Models YN 685 N para cámaras Nikon - Número Guia de 60 a ISO 100 (zoom 200mm). - Modos de trabajo disponibles: i-TTL, Manual y Multi (Estroboscópico) - Tiene un zoom automático / manual de 20-200mm. Difusor extraible en el cabezal. - Internal radio receptor 2,4 Ghz compatible with los trigger de Yongnuo. - Protección contra el sobrecalentamiento. - De forma adicional puede ser controlado desde el flash Yongnuo 560 IV de forma manual. - Pantalla transera LCD de facil lectura y visualización. - Puede sincronizar en HSS hasta 1/8000 de segundo con cámaras y disparadores compatibile. - Tiempo de reciclado de uns 3 segundos a máxima potencia. - Funciona con 4 pilas AA (No includeidas) - Entrada para PC Sincro Lateral - Soporta configuración por grupos y canales. - Funciones personalizables con auto-guardado. - has ayuda al enfoque - Sonido audible de carga disponible. - Cabezal turnaround 360o and tiltable. - Función FEC / FEB en increments de 1/3. European distributor of photos, videos, audio, electronic products and consumer health that carry almost 50 brands worldwide. Radio-controlled flash is a wonderful thing, but the way it was implemented is often infuriating. Each flash seems to need a different transmitter system, and even flashes in the same brand do not necessarily work with all transmitters of that brand. It's something that companies like Godox are trying to do something, but for now it's a bit like the Wild West. Unfortunately, this means that it is not as simple as picking up any flash and transmitter and throwing right into some off-camera flash shooting. One of the most popular budget brands for flashes is Yongnuo. And for good reason – they make good, capable flashes that sell for a fraction of the price of those from the big producers of names. The manual flash YN560-IV is perhaps the most popular and I have many. But while they have integrated radio receivers, they do not have TTL or high-speed synchronization. If you are looking for these features, you might wantclimb to Yongnuo YN685 Speedlite. In many ways, the YN685 does what many other flashes do. But there are some weirdos to use it, especially when using wirelessly. It also does some things different from other Yongnuo flashes, including the popular YN560-IV, so it's not entirely intuitive even if you're climbing from other Yongnuo flashes. So I put together some tips to work with the Yongnuo YN685 Speedlite. Because as much as I like Yongnuo flashes, clear manual instructions are definitely not one of their strong clothes. But I would like to say that this is not understood at all.a complete guide for using the YN685. I'm not very interested in the simple aspects that basically work like any other flash. What I'm focusing on here are some of the quirks and gotchas I met in the hope that by sharing them it could save someone else a bit of time solving the problem or aggravating trying to find features that the flash does not have. Because YN685 is a good flash, but it is not always as intuitive to use as it could be. Yongnuo YN685 Features First, what it has: Built-in 2.4 GHz Wireless radio receiver According to the manual, it can be wirelessly activated by these model numbers: YN-622N, YN622N II, YN622N-TX, YN660, YN560-TX, RF605, RF603II and RF603. I only used it with YN622N-TX and YN560-TX II transmitters. With these combinations, there are some things to know and look out for- there is more on this below. The mileage may vary with different transmitters. TTL compatibility You can use TTL on-camera and off-camera (with a compatible controller). High speed synchronization (HSS) With a compatible camera and transmitter, it can synchronize at high speed up to 1/8000 seconds. Firmware Update You can download firmware updates from Yongnuo website and apply them to flash. What Yongnuo YN685 does not have optical slave mode. There is no optical sensor, so you cannot turn this flash wirelessly using light from another flash. Master unit. You cannot use this as a master controller. Yongnuo 685 Quirks with wireless installation YN622N-TX If you are using the YN622N-TX, there are some things to look for. 622 R. Slave trigger mode. Put the flash in mode 622 R. Slave holding the Mode button until the mode flashes and then using the wheel to scroll the options.is unnecessarily confused, because on most other flashes, including others of Yongnuo, the slave mode refers to the optical slave mode where the flash is activated when you see theof light from another flash drive. But 685 does not have an optical slave mode, and in this case 622 R. The slave setting actually refers to putting the flash in wireless receiver mode. Even more confused, the instruction manual refers to this as "remote control mode". It would be much clearer if they just abandoned the use of "schiava" here and called it 622 Receiver or 622 Remote Mode. 622 R. Slave vs 622 M. Slave. The 622 R. Slave mode allows you to change the intensity and zoom wirelessly from the transmitter. The 622 M. Slave mode (or multi mode) blocks the intensity setting to what you set on the flash drive itself and acts more like a simple wireless trigger. However, you can set the zoom remotely in the 622 M. Slave mode. Manual mode. To use a wireless configuration, the flash must be in Manual mode (M) even if you want to actually shoot with TTL flash measurement. This is not unique to the YN685, but it seems counterintuitive at first. And you will find that when you change the trigger mode to 622 R. Slave, it will automatically change the flash to M. You can then use the YN622N-TX transmitter to switch to TTL (it will still say M on the flash drive itself) and compose in any flash intensity compensation up to 3 stops in both directions. Remote control of intensity and zoom. The YN622N-YX can set the flash intensity and zoom in the activation mode 622 R. Slave (or only the zoom on mode 622 M. Slave), but there is a quirk in the way they are refreshed on the LCD flash screen. If you change the zoom on the transmitter, you can have this reflected change on the flash LCD screen by pressing half of the shutter (you should immediately get a blue light on the back of the flash to show an active connection, but it does not stay long as a saving functionthen you will feel the flash head zoom in or out at any focal length you are using and the value will be shown on the back of the flash. but if you werethe setting of intensity on the transmitter, you will not see that reflected on the flash even with a half press of the shutter. You will only see that change when the flash is fired, either by completely pressing the shutter or using the transmitter test button. [Note this behavior is different if you are using the Yongnuo YN560-TX II controller; more on the one below.] Wireless zoom control. To control the flash zoom using the transmitter, you need to make sure that the flash zoom setting is set to auto. The way you do it is to press the zoom button on the flash (extreme left of the white button line) and then use the wheel to scroll the manual focal lengths until the small M does not change to a small A. That A means that the flash is in automatic Zoom mode. Wireless TTL. If you look at the flash instruction manual on how to use the wireless TTL, you will get this way: If you need to use the off-camera TTL mode, please switch to remote activation mode. [p.22] It took me a few moments to understand what it meant. Then let me rewrite more clearly than it actually matches the flash settings: To use TTL wireless, use 622 R. Slave activation mode. It doesn't work in 622 M. Slave activation mode because the flash ignores the intensity instructions in that mode. Using the YN685 with the YN560-TX II controller The biggest thing to know with this controller is that it will not give you TTL-is a manual flash controller, after all. But there are a couple of other things worth knowing. You can still control the intensity of the flash and zoom (with some limits) and work with groups and channels. 603 slave shield mode. This is the mode where the flash is inserted to get the radio signal from the controllerll. Updating settings on the screen. The problem I mentioned above about how the settings are updated on the LCD flash screen is not a problem when using this controller because they are updated in real time. ↩ And when ↩the intensity on the controller that immediately appears on the LCD flash screen. Same for zoom. Zoom range. The YN685 flash has a range of 24mm to 200mm zoom, but the YN560-TX II controller has only a range of 24mm to 105mm zoom. Then you will not be able to enlarge right when using this controller. Controller. yongnuo yn685 nikon manual pdf
